E-mail address: anna.bedbrook@inserm.fr (J. Bousquet).

1 Deceased authors.
Falls represent a major cause of burden and death in older adults. The MACVIA-LR (fighting chronic diseases for active and healthy ageing in Languedoc-Roussillon) falls initiative is a cross-cutting Living Lab based on the European Innovation Partnership on Active and Healthy Ageing (EIP on AHA) at the regional level. It covers all action plans (A1, A2, A3, B3, C2 and D4) of the EIP on AHA. The Living Lab will: (i) raise awareness, (ii) drive attitude change with respect to falls and falls prevention and (iii) improve access to information on falls prevention. It aims to reduce fall-related hospitalisations by 30% in 2020 in the région Languedoc-Roussillon (LR). It includes: (i) a falls prevention clinic for the assessment of subjects (with a falls risk) in the two teaching hospitals of Montpellier and Nîmes, (ii) the Regional Ageing Institute (CARSAT-LR), (iii) the Low Vision Institute of Nîmes, (iv) the Lattes Social Welfare Centre, (v) the home automation Institut méditerranéen des métiers de longévité, (vi) teaching, training and coaching as well as (vii) industrial partnership. Two care pathways have been developed (stroke and falls) and are being applied to remote rural areas of the région. The MACVIA-falls prevention initiative is an output of the EIP on AHA.

caused by numerous factors including mental health disorders [5], depression [6], impaired vision, certain medications (especially psychotropic drugs) [7], decreased activity of daily living and impaired cognition. A multidisciplinary approach is therefore optimal [8]. Approximately 30% of falls result in an injury that requires medical attention, with fractures occurring in approximately 5% and hip fractures in 1% [9–11]. Falls are the third leading cause of years lived with disability and are one of the leading causes for hospitalization. Falls can also have psychological consequences resulting in reduction of physical function and social interaction. Falling puts a strain on the family and is an independent predictor of admission to a nursing home. Falls in nursing homes are common [12,13], and the rate is much higher than in ambulatory older subjects [14]. Falls represent around 15% of overall hospital admissions. Confirmed diagnoses of fractures of the femur account for 10% of overall admissions [15], and fractures in nursing homes represent between 1 to 2% [16].

Falls are also the most common type of inpatient accident, and account for up to 70%. Approximately 30% of hospital patient falls result in physical injury, with 4 to 6% resulting in serious injury [17].

According to the European Network of Living Labs (ENoLL) (http://www.openlivinglabs.eu), a Living Lab is a real-life test and experimentation environment where users and producers co-create innovation, Public-Private-People Partnerships (PPP) fostering user-driven open innovation. It allows research results to be deployed in real life for all users.

The MACVIA-LR falls initiative is a cross-cutting Living Lab based on the EIP on AHA at the regional level. It covers all of the action plans (A1, A2, A3, B3, C2, and D4) of the EIP on AHA. The Living Lab will: (i) raise awareness, (ii) drive attitude change with respect to falls and falls prevention, and (iii) improve access to information on falls prevention (http://www.chu-montpellier.fr/fr/acteurs-de-sante/prises-en-charges-specifiques/personnes-agees/projet-macvia-lr) (Fig. 1).

The Languedoc-Roussillon region (budget of 1.2 billion €, 3200 members) has the following mission: to address the issues of education, training, economic development, long-term national and regional development, research and public health. Social care is vital (highest population growth rate in Metropolitan France) and the region has made important investments in the training of health and primary prevention (health education programme for 15–25 years old) (Fig. 2).

2. Falls prevention clinics (A2)

2.1. Montpellier university hospital

The falls prevention clinic of the Montpellier hospital is interconnected with a centre that includes other activities on falls (Table 2).

The LR Balance and Falls Prevention Clinic is based in the Montpellier university hospital (CHRU). It is a specialist medical clinic for people who have fallen or who have been screened by their general practitioner (GP) as having a significant risk of falling (people who complain of fear of falling, balance disorders, dizziness, low muscle strength in the lower limbs). In accordance with their GP, some of the patients have been screened through public awareness/information campaigns organized by the different municipalities around Montpellier.

Every year, the LR Balance and Falls Prevention Clinic tests around 200 patients aged 65 years or above. Patients at risk of falls (or recurrent falls) benefit from a 3-hour geriatric multidimensional assessment by a geriatrician and a physiotherapist. Based on this first assessment, the clinical assessment may be supplemented at the same time by other examinations (urologist, ophthalmologist, ENT, dietician, social worker) [18]. If needed, a bone density scan is performed to check for osteoporosis, as recommended recently [19–21]. Based on this comprehensive examination, a management plan for falls and fracture prevention is given to the patient and mailed to the referent physician. This plan includes tailored physical exercises to improve balance, muscle strength, flexibility, and motor coordination. Documents are also given to the patient (ProFouND tools, in particular) [22] (http://www.chu-montpellier.fr/fileadmin/Docutheque/Tripli_PreventionChute_1112_200ex.pdf). The examination is complemented by the home visit of an occupational therapist. Depending on the results of the assessment, patients may be oriented towards physical activity training groups developed in collaboration with city councils and the University Department of Science of Physical Activities and Sports. A network of specialists particularly interested in falls prevention (physiotherapists, occupational therapists) has been created, with regular meetings to disseminate new evidence in falls prevention. http://www.cdomk34.fr/index.php/newsletter/archive/view/listid-1-mailinglist/mailid-58-invitation-du-cdomk34

The LR Balance and Falls Prevention Clinic has a local recruitment of people at risk of falls and is a resource centre for GP’s and hospitals throughout the area. It is also a research and teaching centre that helps to coordinate research (in link with Euromov, M2H), education (in link with STAPS), and dissemination in the field of falls prevention in LR. The clinic provides its experience and helps to create falls prevention consultations and Day hospitals throughout the region.
The interoperable ICPs for falls prevention uses DXCare® (MedaSys, http://www.medasys.fr and Orange business service (http://www.orange-business.com). This is the most common ICT tool used in French hospitals. Also operational in SaaS (Software-as-a-Service) mode, DXCare® allows procedures and coding to be collected within the patient records, and offers flexibility of implementation. It is operational in Montpellier (IPSoins®) [23].

Behavioural and psychological symptoms and depression predict falls among nursing home residents, independently of physical performance and psychotropic drugs [7]. As an example, lavender olfactory stimulation may reduce agitation and falls in elderly nursing home residents [24]. The Altera group has developed a programme of cognitive stimulation activities using touchpads adapted to nursing home residents with cognitive impairment (http://www.altera.com). The objective of the ongoing study conducted in 50 nursing homes in the LR region is to demonstrate that Kodro may improve quality of life and prevent cognitive decline, behavioural disturbances and falls in nursing home residents with cognitive deterioration (http://www.kodro.fr).

2.2. Nîmes university hospital

The physiotherapy and rehabilitation centre of Nîmes university hospital accommodates patients suffering from loss of autonomy, in particular further to a fall. Since 1995, it has been developing programmes for the recovery of postural control and to enable patients to regain their autonomy. In these programmes, the patients benefit from care and support until they return to their place of residence (Mobile EGERIteam). The centre has a clinical, instrumental, and technical evaluation platform for postural control. Moreover, patients at risk of fall (especially those with neurodegenerative diseases and orthopaedic disorders) are screened in the centre. It functions in association with the Memory centre and implements physical activity prevention programmes (Table 3).

3. Regional ageing institute (CARSAT-LR) and independent living (C2)

CARSAT-LR is a member of the National Social Security organisation. It participates actively in the Living Lab Falls-MACVIA-LR project within the framework of its Institut Régional du Vieillissement (Regional Ageing Institute) which includes 5 operational centres:

- an observational centre;
- an approval and evaluation centre;
- a global and flexible office for all services to simplify access and provide advice and guidance to retired or pre-retired social
security contributors who are at risk of frailty. As soon as a patient at risk of fall is detected, a plan is established in order to direct him/her towards identified preventative workshops or adapted establishments (prevention centres);

- an advisory centre for relevant training;
- a research, study and experimentation centre.

4. Low vision institute (A2, D4)

The impairment of vision is associated with a loss of function in activities of daily living. Avoidance of physical activity and consequent reduced functional capacity is common in older people with visual impairment and is an important risk factor for falls [25,26]. The ARAMAV institute in Nîmes is a multi-disciplinary centre which aims to improve the vision of adults with a severe visual impairment. It includes training for improved vision by an ophthalmologist and an orthoptist [27]. This evaluation enables environmental and behavioural interventions to be determined with occupational therapists and/or psychologists to increase mobility and quality of life.

5. Age-friendly environments (D4)

5.1. Pôle autonomie en santé in Lattes (PAS), étape

PAS proposes multisectoral innovative solutions to enable older and/or handicapped people to maintain independent living (Fig. 2). The PAS project is managed by the city of Lattes’ Social Welfare Centre and is comprised of elected representatives of the city, the départment de l’Hérault (General Council) as well as citizens (http://www.etape-pole-autonomie-sante-lattes.org). It includes representatives of clubs and societies for senior citizens. PAS offers a free municipal public service dedicated to supporting the population in the choice and testing of technical and technological aids: ETAPE. PAS provides information for a database in accordance with the ISO 999/2011 norm for assistive products available in the centre. ETAPE promotes ICT products and services adapted to older people’s needs through the promotion of better access to urban services, higher autonomy and home services. It is participating in a pilot study to create a national database for the CNSA (Caisse nationale de solidarité pour l’autonomie). ETAPE is part of the Smart Eco City® of the Montpellier Agglomeration. Around 1100 persons (handicapped individuals, social workers, family members) visited ETAPE in 2013. Falls prevention represents a large percentage of the needs of these subjects.

Given its mission of technology watch and referencing of innovative solutions for autonomy, ETAPE collaborates with approximately one hundred companies in order to test and demonstrate their products. This mission enables ETAPE to work with these companies to develop protocols of experiment and feedback with regards to their innovative solutions.

There are close links between ETAPE, the Balance and Falls Prevention Clinic of the Montpellier hospital and I2ML. Satellite centres are being implemented in the Region and the first one is situated in Lodève (remote rural area in the Hérault department).

6. I2ML, home automation and silver economy (D4)

The I2ML (Institut méditerranéen des métiers de longévité) Fondation Partenariale was established in 2011 by the University of Nîmes and 20 founder members and partners, including the Région LR, the Nîmes Métropole, the Conseil Général du Gard, the university hospital of Nîmes, insurance companies and other...

7. Education, training and coaching

The Universities of Montpellier 1, 2, 3, the major training centres in Europe, the University of Nîmes and the École des Mines d’Alès (Alès technology and engineering university) are involved in training activities. Founded in 1843 in Alès, the École des Mines has developed and adapted to changes in industry and society. Founded to study the mining industry, it is now an engineering school (Grande École) with an international reputation that forms multidisciplinary engineers. (http://www.mines-ales.fr)

ETAPe is used by the INRS (Institut national de recherche et sécurité, http://www.inrs.fr) for the training of occupational health and safety.

ITEV: the Institut transdisciplinaire d’étude du vieillissement (transdisciplinary institute for ageing studies (http://www.itevephe.univ-montp2.fr))/ is an institute of the École pratique des hautes études (http://www.ephe.sorbonne.fr). Two teaching courses are effective in Montpellier in collaboration with the CNAM: (i) for the professional care givers of older people and (ii) for nurses in nursing homes.

Trans InnovLongévité (investissement d’avenir, Agence nationale de la recherche http://www.agence-nationale-recherche.fr) is a transdisciplinary, multisectoral, private-public partnership whose aim is to provide training and coaching on frailty, falls, ageing and independent living. It uses ICT teaching of 3 universities (Paris, Montpellier, Strasbourg: http://www.aunege.fr) and French speaking countries.

Master Institute Télécom ICT and health: a joint training course that includes University Montpellier 1 and 2, the École des Mines d’Alès and the Télécom Institute for the multidisciplinary training of students (from ICT, physics, biology, medicine, pharmacy or sports) and citizens (http://www.telecom-montpellier.fr).

8. Research activities

Basic and translational research is being carried out by the Inserm and CNRS units of the region. Moreover, EuroMov is a nexus for research, technology, and innovation in the Movement Sciences. EuroMov conducts state-of-the-art research on human normal and pathological movements, with high-level academic and professional training, technological development and business incubation (http://www.euromov.eu). The new EuroMov building (2500 m²), in the north of Montpellier, hosting all activities of the centre, was launched in June 2013, during the international conference Health in motion (organized by the EuroMov research unit -Movement to Health (M2H, Montpellier-1 University)). (http://www.euromov.eu)
9. Care pathways at the regional level with physicians (A3, B3), pharmacists (A1), nurses and social workers (A3, B3, D4)

Ninety-seven percent of French private pharmacists use the Dossier Pharmaceutique® (DP®). The vast majority of patients agree to be followed by the DP®. Coverage includes over 35% of people in France (all ages). A project in collaboration with pharmacists and nurses will screen for possible falls in subjects over 75 years of age visiting pharmacies and nurses. This programme will include measures that can be taken to reduce the incidence of falls. It will also include an assessment of psychotropic drugs and their relation to falls using the DP® (A1).

Based on the results of the project, an integrated care pathway for falls prevention will be established between pharmacists, nurses, primary care and an existing falls prevention clinic. If needed, adapted physical activity, interactions with social workers (CARSAT) and age-friendly coaching (D4) are proposed to the patient. The Sports Faculty in Montpellier and Euromov implement adapted physical activity programmes (the “posture, balance, motor skills, and education for health’’ method: méthode posture-équilibrio-motricité et éducation pour la santé (PEM-ES)), available in the main cities of France (activité physique adaptée à la santé: APA, C2) (http://www.apa-sante.fr)

10. Care pathways for stroke (A1, A2, A3, B3, C2, D4)

Falls are one of the most common medical complications after stroke, with a reported incidence of up to 70% in the first year post-stroke [28]. The best medical approach to manage this potentially life-threatening emergency and its long-term functional consequences is early intravenous or intra-arterial infusion of thrombolytic agents and the admission to a Stroke Unit. In the Stroke Unit, a multidisciplinary team will integrate and coordinate the different aspects of acute stroke management such as maintaining cerebral homeostasis, cardio-vascular monitoring, early mobilisation and neuro-rehabilitation. In LR, a care pathway for the prevention and management of stroke was initiated in 2010 (Plan national d’action AVC 2010-2014, http://www.sante.gouv.fr). In the first phase of the plan, 10 actions were initiated in LR including information and prevention, care pathways coordination and coaching. In the region, two different situations exist and can be compared:

- The coastal region (2.6 million inhabitants) has 5 integrated neuro-vascular units (stroke units). Each stroke patient is urgently (within the hour) sent to a stroke unit. The patient receives immediate care by a multidisciplinary team. An emergency MRI is carried out and a decision is made with regards to the administration of thrombolytic treatment. A rehabilitation programme is then set up. The stroke unit within the Montpellier University hospital is equipped with interventional neuroradiology for thrombectomy.

- The Lozère department (remote rural area, 80,000 inhabitants) does not have a stroke unit. The general hospital is equipped with an MRI scanner that is always available for emergencies, as well as emergency physicians adequately trained in thrombolysis. Tele-health is used to enable neurologists from the Montpellier University Hospital to make urgent medical decisions. This procedure reduces post-stroke disability and complications as much as possible. Prevention and rehabilitation programmes are significantly linked to the risk of post-stroke falls.

A dual approach has been initiated: stroke units in emergency departments and tele-health-based emergency in Lozère. The first results indicate 3 positive elements:

- earlier and better care in the stroke unit;
- better adapted rehabilitation programmes.

This “Hit hard and fast” method is managing to reduce the number of people who suffer from post-stroke disability in LR.

11. Interactions at the local, regional, national and European levels

11.1. Public partnership

The Living Lab includes most public institutions of the Languedoc-Roussillon which have an interest in a falls prevention initiative (Table 4). All of these institutions are linked with social workers through municipal social and welfare community centres (CCAS) as well as the ARS and CARSAT.

11.2. Private partnership

Members of the Living Lab include the Conseil régional LR de l’ordre des médecins (Regional medical board), the URPS médecins, pharmacists, and nurses (Union régionale des médecins libéraux du LR), the University Department of General Medicine, and the Conseil régional LR de l’ordre des pharmaciens (Regional pharmacy board).

Industrial competitiveness is managed through Eurobiomed (French government “competitive cluster” (http://www.eurobiomed.org)) and the silver economy (12ML). The Eurobiomed biotechnology cluster federates 216 members, mainly SMEs, 5 universities, higher education establishments, 400 research laboratories, 4 university hospitals and pharmaceutical groups.

In Europe, spa therapy, largely prescribed for osteoarthritis, particularly for the knees, was found to be effective [29,30]. The Balaruc-les-Bains Thermal Baths offer a wide range of water, steam, and mud treatments for rheumatologic diseases. It is the third largest thermal spa in France, and does its utmost to welcome over 45,000 patients each year. Balaruc is developing a specific falls prevention initiative.

AxlR is a technology transfer acceleration company. It specialises in helping innovative projects derived from academic research reach maturity and commercialization. This single window access increases the efficiency of the innovation system and the competitiveness of the industry (http://www.axlr.com).

CR2i (Centre for research and industrial innovation) aims to produce closer medical diagnostics and new technologies. Supported by the cluster Eurobiomed, CR2i is dedicated to ICT and the health sector, bringing together actors in diagnosis, therapy and new technologies. CR2i develops and industrializes new solutions for health diagnosis and telemedicine, particularly in the areas of personalized medicine, ambulatory medicine and telemedicine (http://www.eurobiomed.org/pdf).

11.3. Patients’ organisations

ETAPE serves as a mediator between users and professionals from the medico-social sector whose mission is to help people who are losing their autonomy to stay at home. ETAPE collaborates with the main patients’ organisations in the LR region: Association des paralysés de France, Association France Alzheimer, Association française de myopathie téléthon, la Fédération des aveugles et amblyopes de France, Comité de liaison et de coordination des personnes handicapées de l’Hérault, le CLIC maillage, le groupe-ment pour l’insertion des personnes handicapées physiques du Languedoc-Roussillon, Association France parkinson, Cap horizon (blindness).
11.4. French national partnership

I2ML is a founder member of the National Living Labs forum in health and independent living and represents the Living Lab Falls-MACVIA-LR. I2ML is also a member of CNR santé.

The Living Lab Falls-MACVIA-LR collaborates with different French teams in different educational and research projects in pre-frail and frail older people with the aim to prevent falls. The Living Lab Falls-MACVIA-LR participates in the French group that has been assembled by Inserm to write guidelines on “physical activity and falls” and in the falls interest group (created in 2014 in the French Society of Geriatrics and Gerontology SFGG). Guidelines and teaching programmes are provided at the annual meeting of the SFGG.

11.5. European Union

MACVIA-LR is one of the reference sites of the EIP on AHA [3]. It participates in the Prevention of Falls Network for Dissemination (ProFouND), a new EC-funded initiative dedicated to the dissemination and implementation of best practices in falls prevention across Europe (http://www.profound.eu.com). The Living Lab Falls-MACVIA-LR collaborates with the Falls interest group created in 2014 within the European Union Geriatric Medicine Society Academic Board.
